

SYSTEM AND METHOD FOR THE DELIVERY OF INFORMATION

ABSTRACT

A system and method for the delivery of information. A network permits the transfer of small to large data files through a variety of delivery methods, such as physical or electronic means. The information may include different types of media content, which may be selected and retrieved by a user. The user can select the location and time for delivery of the information, which is retrievable and downloadable to a personal device. This allows users to acquire the information in a relatively short period of time and at neighboring locations.
